A MENU BAR APP FOR MACOS · V0.5

Tiler

Tiling windows, *one desktop at a time.*

Turn it on where you want order. Every other desktop and display stays exactly as you left it.

BikS2013

User guide · for Mac power users

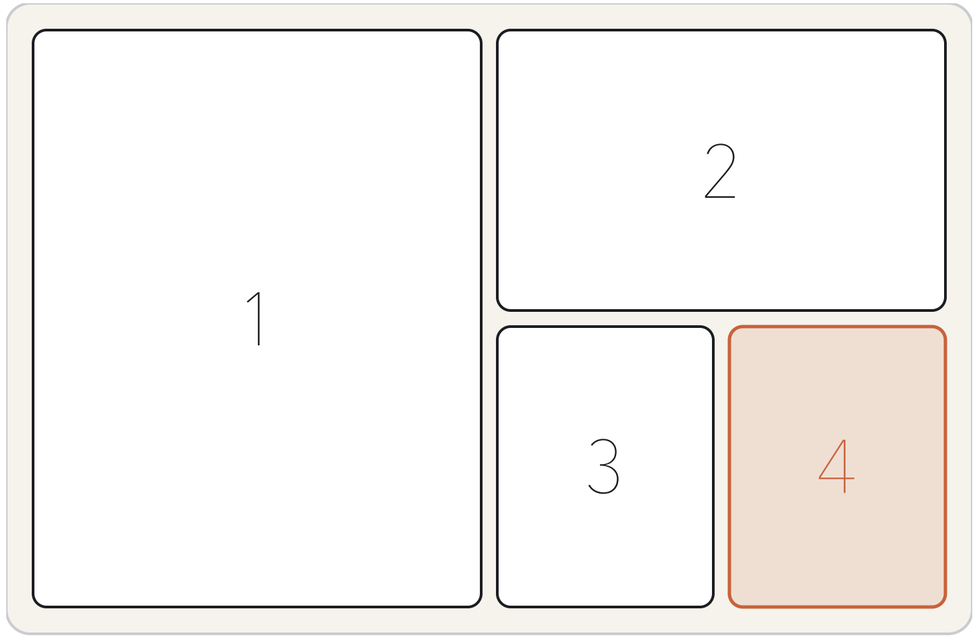

github.com/BikS2013/tiler

A tiling window manager that lives in your menu bar.

Tiler arranges the windows of a desktop so they share the screen with no overlap and no wasted space. Each new window splits the one you were working in, along its longer side (a **dwindle** layout, as in Hyprland).

It works on **one desktop of one display at a time**, and only where you switch it on. Your other Spaces, your other screens and full-screen apps are never touched.

You keep using native macOS Spaces and Mission Control. Tiler just keeps the desktop you chose in order.

1 window fills the desktop. Window 2 splits it side by side; 3 splits 2 top and bottom; 4 splits 3 again, and so on.

Gaps: 8 pt between windows and around the edges.

For Mac users who want order on some desktops, not all of them.

01

Keyboard-first people

Developers, writers, analysts who live in a few windows side by side and would rather press a key than drag a corner.

Focus, swap and resize without the mouse.

02

A tiled workspace, a free one

Tile your coding or research desktop; keep a loose desktop for mail, chat and the odd floating window.

Each desktop is a separate choice.

03

Several displays

Tile the laptop screen while the external monitor stays freeform, or the other way round.

Tiler never moves a window on a screen you didn't turn on.

Not for you if you want every window on every desktop tiled automatically, or virtual workspaces that replace macOS Spaces.

Simple on purpose: fewer moving parts, fewer surprises.

0%

CPU while you work. Tiler only wakes up when a window opens, closes or moves, and goes fully idle on desktops that aren't tiled.

Polling	**none: it reacts to window events**
Keyboard interception	**none: system hotkeys only**
Virtual workspaces	**none: native Spaces**
Permissions	**Accessibility only**
Cost of one update	`≈ 1 ms`
Size of the code	`~3,700 lines`

Measured on macOS 27 with two tiled desktops. Inspired by HyprMac (~35,000 lines), minus its workspaces, keyboard tap and polling.

01

Get started.

Install with Homebrew, allow Accessibility once, then switch tiling on for the desktops you choose.

Two commands, one permission.

```
$ brew tap BikS2013/tiler
$ brew install --cask tiler

# update later: brew upgrade --cask tiler
```

No Homebrew? Download `Tiler-0.5.0.zip` or the `.dmg` from **github.com/BikS2013/tiler/releases** and drag Tiler to Applications.

Signed	**Developer ID, notarized by Apple**
Runs on	**Apple silicon and Intel**
Requires	**macOS 14 Sonoma or later**
Dock icon	**none: menu bar only**

First launch

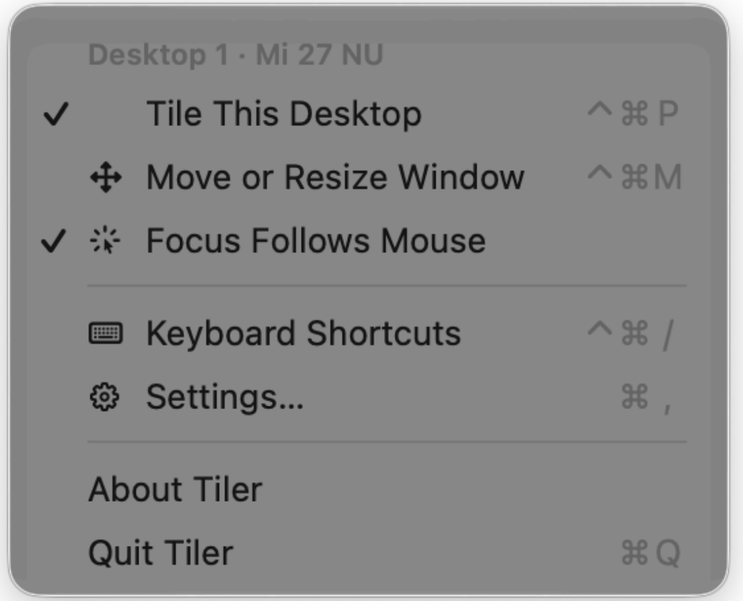

macOS asks for **Accessibility**: System Settings › Privacy & Security › Accessibility › enable Tiler. That's the only permission: no Input Monitoring, no Screen Recording.

Tiling is a switch per desktop, per display.

01 **Menu bar:** click the Tiler icon on the screen you want and choose **Tile This Desktop**. It acts on the display whose menu bar you clicked.

02 **Keyboard:** press ⌃ ⌘ P on the display you're working on (the one with the focused window).

03 **Off:** the same item or key again. Windows simply stay where they are; Tiler stops all work there.

- Remembered across restarts and logins.
- The icon is filled when the current desktop is tiled.
- Full-screen Spaces can't be tiled.
- **Move or Resize Window** (⌃ ⌘ M) and **Focus Follows Mouse** live here too.

02

Everyday use.

Shortcuts for focus, swap, resize and layout; a cheat sheet one key away; keyboard moves for untiled windows; the mouse when it's quicker, and focus that can follow it.

Every shortcut on one slide.

GENERAL · WORK EVERYWHERE

Tile or untile this desktop	⌃ ⌘ P
Show keyboard shortcuts	⌃ ⌘ /
Move or resize an untiled window	⌃ ⌘ M

MOVE AROUND

Focus the neighbouring window	⌃ ⌘ + ← → ↑ ↓
Swap with the neighbour	⌃ ⇧ ⌘ + ← → ↑ ↓

All but the three General shortcuts exist only while a tiled desktop has focus, so the same keys keep working in your apps everywhere else. Change any of them in Settings › Shortcuts.

RESIZE

Vertical divider left / right	⌃ ⌘ [/]
Horizontal divider up / down	⌃ ⇧ ⌘ [/]

LAYOUT

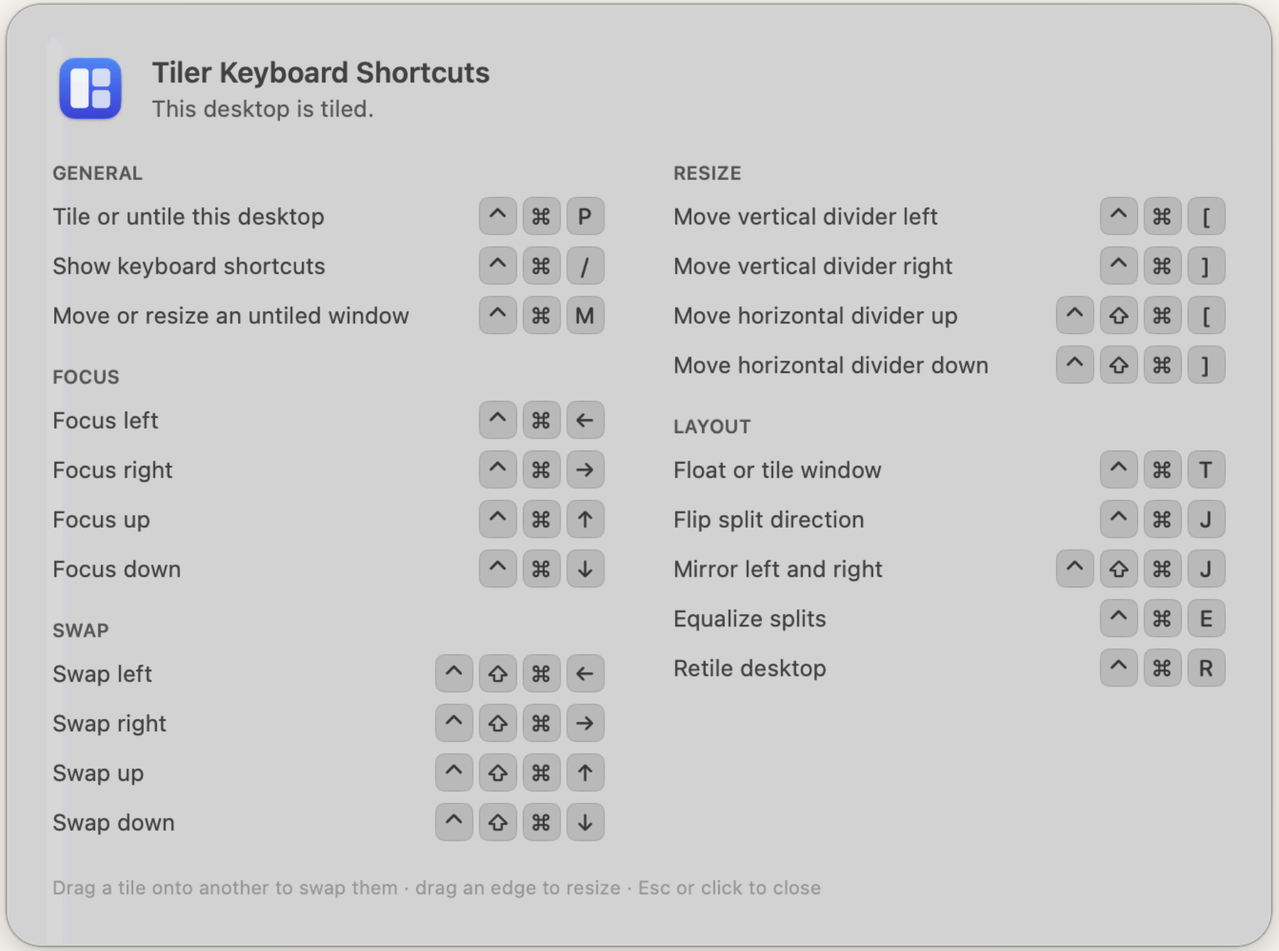

Float or tile the window	⌃ ⌘ T
Flip split (side by side ↔ stacked)	⌃ ⌘ J
Mirror left ↔ right	⌃ ⇧ ⌘ J
Equalize every split	⌃ ⌘ E
Retile the desktop	⌃ ⌘ R

Forgot a key? Press ^⌘/

A translucent panel lists every shortcut, grouped, on the display you're working on. It also works from the menu: **Keyboard Shortcuts**.

It never takes focus, so the app underneath keeps your keyboard and selection.

It closes on **Esc**, a click anywhere, a desktop switch, or the same shortcut again. On an untiled desktop the tiling rows are dimmed.

Untiled windows, by keyboard.

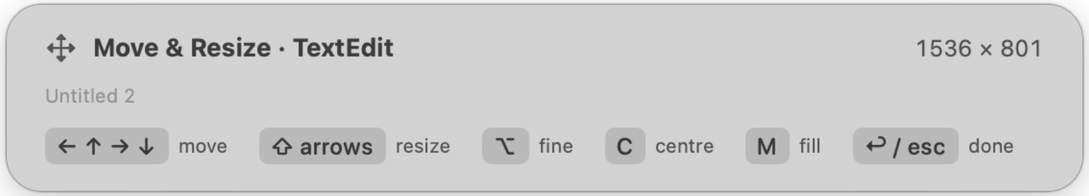

Press ⌃ ⌘ M (or menu › **Move or Resize Window**) and the window you're in can be moved and sized with the keyboard, until you press **Return** or **Esc**.

It works on any desktop, for any window Tiler isn't tiling: a floating window, or every window on an untiled desktop. A tiled window gets a short note to float it first with ⌃ ⌘ T.

The keys are only taken while the mode is on. Switching app or desktop, or a click, ends it too.

WHILE THE MODE IS ON

Move 40 pt	← → ↑ ↓
Resize (right/down grow)	⇧ + ← → ↑ ↓
Fine steps of 8 pt	⌥ + arrows
Centre / fill the screen	C / M
Done	↩ / esc / ⌃ ⌘ M

The mouse still works, and Tiler follows it.

01

Drag onto a tile

Drop a window on another tile and the two swap places. Drop it anywhere else and it snaps back into its tile.

02

Drag an edge

Resize a window by its edge and the split follows: the neighbour shrinks or grows to match, gaps stay even.

03

Drop in, drag out

Move a window onto a tiled desktop and it joins the layout. Drag it to another display and Tiler lets it go.

Float one window: ⌃ ⌘ T takes it out of the layout and centres it at 60 % of the screen. Press again to tile it. It keeps its size and position: across Tiler restarts, and when you float it again.

Floats on its own: dialogs, panels, non-resizable windows, and apps on the Always Float list (System Settings, Activity Monitor, Calculator by default).

Point at a window, and it's yours.

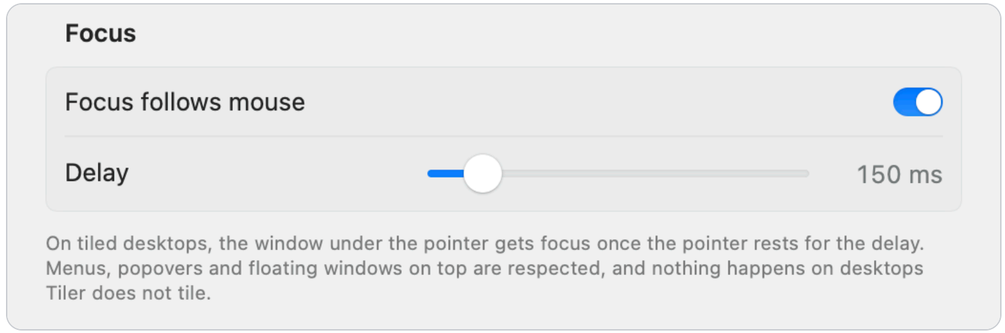

On a tiled desktop, rest the pointer on a window for a moment and it takes the keyboard. No click needed; just passing over a window does nothing.

It is off until you turn it on: menu › **Focus Follows Mouse**, or Settings › General › Focus, where the delay lives too.

Desktops Tiler doesn't tile behave exactly as before.

WHAT IT RESPECTS

Open menus and the app switcher	focus stays put
Popovers and panels on top	they win
Floating windows over tiles	the top one wins
Delay before focus moves	`50–1000 ms · 150`
Cost while the mouse moves	`~0.15 % of a core`

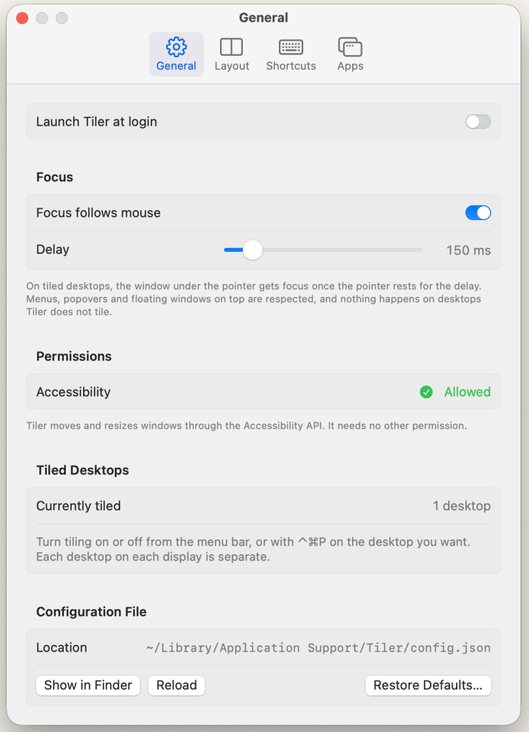

03

Make it yours.

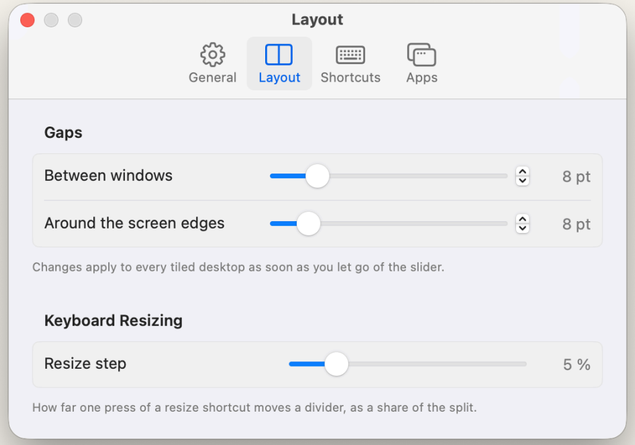

Settings…, from the menu or by opening Tiler again. Every change is saved and applied at once.

General and Layout: startup, focus, gaps.

General

- Launch Tiler at login
- Focus follows mouse and its delay
- Accessibility status
- How many desktops are tiled
- Config file: Show in Finder, Reload, Restore Defaults

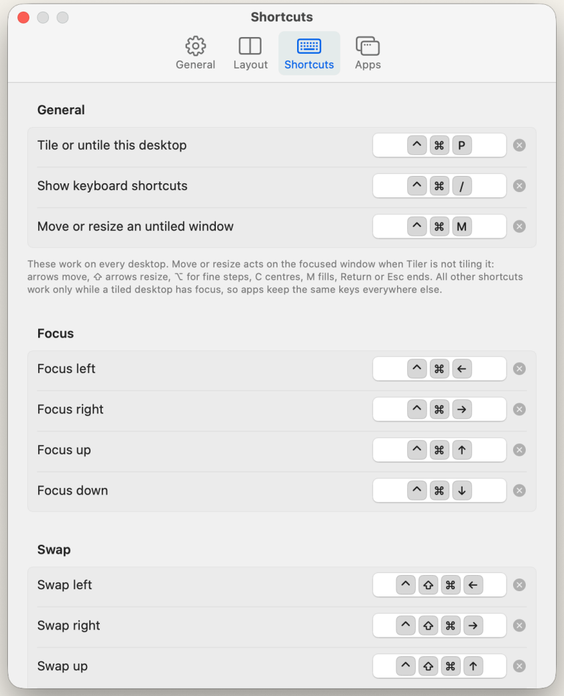

Layout

- Gap between windows
- Gap at the screen edges
- Resize step per key press

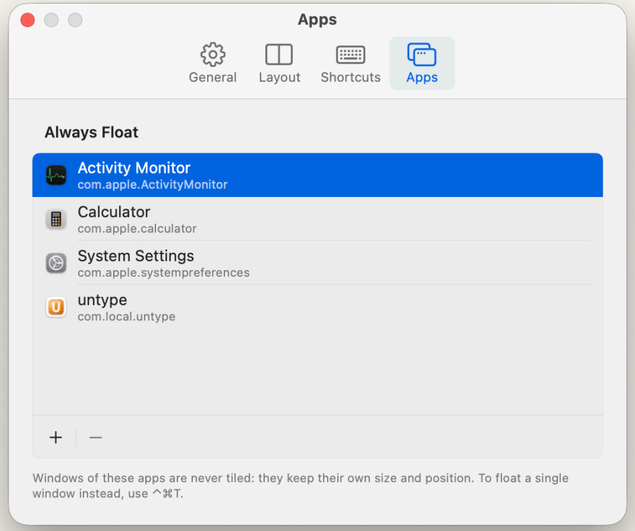

Applied to every tiled desktop when you let go of the slider.

Shortcuts and Apps: your keys, your exceptions.

Shortcuts

- Click a shortcut, press the new keys
- **Delete** clears it, **Esc** cancels
- A key already used by another action is refused, with its name
- Restore Defaults

Apps

- Apps whose windows always float
- **+** picks a running app or one from Finder
- **−** removes the selected app

The config file, a few limits, and how to leave.

01

One config file

Settings writes `~/Library/Application Support/Tiler/config.json`. Prefer a text editor? Edit it, then Settings › General › Reload.

Every key is required. A mistake is shown in the menu and in Settings. After an upgrade, **Add Missing Settings** fills in only the new keys.

02

Known limits

Apps with a minimum size (Outlook needs 770 pt) can overlap their neighbour on a small screen.

If another tool owns a key (Rectangle, Hammerspoon), it wins: pick another key in Settings. Don't tile the same desktop with HyprMac.

03

Uninstall

`brew uninstall --cask tiler` removes the app and keeps your settings.

`brew uninstall --zap --cask tiler` also removes the config and the list of tiled desktops.

TRY IT TODAY

Tile what you want.
Leave the rest alone.

```
$ brew tap BikS2013/tiler
$ brew install --cask tiler
```
